Idiot' s guide to succulents

Debra Lee Baldwin, author of *Simplified Succulents and Succulent Container Gardens*, says that succulents can be grown anywhere by anyone. But even if succulents are tough, hardy plants, they still live things and sometimes things can go a little sideways. Here are five Debra troubleshooting tips for succulents.

1. Why is the leaves on my succulent bleached, yellow or have black spots? Causes of pain dyes on too much sun succulents. Try moving to a place that still receives the sun, but suffers more shade throughout the day.
2. Why did my succulents puffy and squished? The secret of No. 1 to keep succulents is not to overwater them, and overwatering is the culprit here. If the root dies, take clippings from healthy tissue and repot in the new soil. Next, check out the eight succulents that make a great ground cover.
3. My succulent leaves are mushy and have collapsed. What should I do? The cause here is frost. Cover the plants or move them in the house until the temperature rises.
4. Why are the leaves and stems unfolding? Succulent you are trying to approach the source of light, because they do not receive enough light. Adjust their location to somewhere sunnier.
5. The leaves on my succulent have lost their shine and their tips are shredded, what happened? There is not enough water. A good rule is to keep the ground only as dry as the wrong sponge. Plus: How to Make A Wood Log Grower for Succulents

See more than Birds & Blooms here. The site is not available in your country the beautiful tablet composition of succulents was planted a few five years ago by Harwich, Massachusetts-based gardener Paula Riedl. Shown here are, among other things, *Senecio serpens* (blue plants on the top left of the photo) and *graptopetalum* (which is orange-yellow). Riedl notes, the wonderful thing about succulents is they don't need any maintenance. They must be kept in well-drained soil—one part of the pot land to one part of coarse sand is the best—so it helps to use a cement pot with drainage holes, like this. Succulents need a lot of sun and only need water once week during the growing season. They are not strong enough to stay out during the winter months in locations where freezing may occur; in such a climate, they must be brought into a heated room or greenhouse where there will be sufficient sun.

We believe part of the satisfaction of living with inner plants is in their medium needs, and just as much pleasure can be found in the humble cactus as in a conservatory full of demanding tropical plants, write London garden designers, [Caro Langton and Rose Ray](#) in their new book, *House of Plants: Living with Succul, Air Plants and Cacti* Ultimately, they are a guide for those who have never considered developing a green thumb until now. It may be your inner greenery you will find you when you are least ready: given as a gift, or perhaps steal your attention while strolling through the local market, write them. The duo cover all the needs to keep your plants alive and kick in: day care, common illnesses to see, terms to know. Read on to find their three genius tips to keep the plants of the moment: succulents. Succulents love direct sun, but if you're sitting in the same place day by day, chances are only one side gets enough light. Langton and Ray suggest spinning plants often. Just like us, succulents need more energy when they are in a period of growth. During spring and summer, plants thrive and drink more water than when they rest in the fall and winter. Langton and Ray recommend testing the ground with a finger—when the top 1 1/4 inches dry, take your water can. Inevitably, your inner plants will gradually take dust on their surface, which can prevent their growth, write Langton and Ray. Wipe the leaves and spine gently with a damp cloth (use a soft paintbrush to get in a place achieved). How did your succulent garden grow? If you cultivate a garden of a few beautiful dishes, village log growers overflowing with succulents, or a trio of concrete growers with large flesh-leaf specimens, succulents have never been more trendy than they are now. A variety of colors, textures, and succulent shapes provide gardeners with a variety of ways to fairy gardens, living wreaths, and vertical growers. Here are nine types of popular succulents to add to any bright windows for low-maintenance houseplants. Although succulents are generally considered desert plants that are like dry conditions and bright sunlight, that's not true of all species. Some succulents are rainforest plants that require more moisture and humidity, and some do not do well in direct sunlight. Sunlight.
